

Polishing Balls

Polishing balls typically refers to the process of refining and enhancing the surface of spherical objects, often for industrial or manufacturing purposes. The term is commonly associated with precision ball bearings, which are crucial components in various machinery and equipment. The polishing of balls is essential to ensure smooth surfaces, reduce friction, and enhance the overall performance of these components

Features

- ▶ Balls are inspected for defects, irregularities, or imperfections before the polishing process begins.
- ▶ The balls are thoroughly cleaned to remove any contaminants, dirt, or debris that could affect the polishing process.
- ▶ In some cases, the balls may undergo a grinding process to remove excess material and achieve a more precise spherical shape.
- ▶ The polishing process involves using abrasive materials and polishing compounds to refine the surface of the balls. this step is crucial for achieving a smooth, uniform surface.

DOIT INDUSTRIES INDIA PVT. LTD.

Certified ISO 9001:2015

Corporate Office :

Unit No.304,New India Industrial Estate, Near Paper Box, Off. Mahakali Caves Road, Andheri (East), Mumbai-400 093.
